

HARSHITA VADLAMUDI

269-366-1539 | harshitavadlamudi4@gmail.com | [LinkedIn](#) | [GitHub](#)

PROFESSIONAL SUMMARY

Full-stack Java developer with hands-on experience building Spring Boot REST APIs, MySQL-backed data layers, and React.js interfaces, deployed on AWS (EC2, RDS, S3) with Docker and Jenkins CI/CD. Backed by an M.S. in Information Systems and graduate research automating Python workflows in the cloud. Comfortable across the stack from backend services to database design to front-end integration.

TECHNICAL SKILLS

Languages: Java, Python, SQL, HTML, CSS

Frameworks & Tech: Spring Boot, Spring MVC, Spring Security, Hibernate, JDBC, React.js, RESTful APIs, CustomTkinter (Python GUI)

Databases: MySQL, SQLYOG

Cloud & APIs: AWS (EC2, S3), REST API integration & consumption, LLM/prompt engineering

DevOps & Testing: Docker, Jenkins CI/CD, JUnit, Mockito, Git, GitHub, Eclipse IDE, Apache Tomcat

PROFESSIONAL EXPERIENCE

Java Developer

April 2022 – May 2024

Fratello InnoTech Pvt Ltd, Hyderabad, India

- Developed and enhanced backend services for the Khrana Eats online food ordering platform using Java, Spring Boot, Spring MVC, and Hibernate, implementing features such as restaurant management, menu catalog, order processing, and customer profile management through RESTful APIs.
- Designed and optimized MySQL database schemas and SQL queries for order, payment, and inventory data, improving data retrieval performance and ensuring transactional consistency during high-volume order processing.
- Built and integrated responsive interfaces using React.js, JavaScript, HTML5, and CSS3, enabling customers to browse menus, place orders, and track order status while consuming backend REST APIs.
- Deployed and maintained application services on AWS (EC2, RDS, and S3), containerized applications with Docker, and supported Jenkins CI/CD pipelines to streamline deployments across development and production environments.
- Implemented Spring Security with JWT-based authentication, developed unit and integration tests using JUnit and Mockito, and participated in code reviews to improve application reliability and maintainability.
- Collaborated with product managers, QA engineers, and cross-functional Agile teams throughout the SDLC, from requirement analysis and feature development to testing, deployment, and production support, resolving critical issues to ensure a seamless customer ordering experience.

Graduate Research Assistant — AI & Cloud Initiatives

April 2025 – Aug 2025

Central Michigan University, Mount Pleasant, MI

- Integrated multiple REST APIs for automated data retrieval and LLM-based insight generation, applying request/response patterns transferable to Java RESTful services.
- Automated manual, repetitive data-processing steps in research workflows using Python scripts, improving efficiency and reliability.
- Deployed and configured backend components on AWS EC2 and S3, the infrastructure used to host and scale production Java applications.
- Researched and evaluated emerging generative AI frameworks to support backend and data engineering coursework.

PROJECTS

Overhead Flight Tracker

<https://github.com/HarshitaVadlamudi/flight-tracker>

JavaScript, HTML, CSS, REST API (Open Sky Network)

- Built a web app displaying real-time overhead aircraft using live ADS-B data from the Open Sky Network REST API.
- Implemented geolocation-based auto-detection and an adjustable search radius (10–150 km) to filter nearby flights.
- Developed flight-phase detection logic (takeoff, climb, cruise, approach, landing) from altitude and vertical-rate data.

Delta Flight Delay Predictor

<https://github.com/HarshitaVadlamudi/flight-delay-predictor>

JavaScript, HTML, CSS, REST APIs (AviationStack, Open-Meteo)

- Built a web app predicting Delta flight delay risk by combining live flight data with real-time departure/arrival weather.
- Integrated AviationStack and Open-Meteo REST APIs to compute a Low/Medium/High delay risk score.
- Designed a risk-factor breakdown view explaining how weather conditions contribute to the prediction.

Auto Service – Vehicle Service Booking & Management System

Personal Project

Python, CustomTkinter

- Built a desktop vehicle-service booking and management application in Python (CustomTkinter) with separate customer and admin interfaces.
- Developed customer modules for login, multi-step appointment booking, service history, and profile/vehicle management.
- Built an admin dashboard tracking bookings, 85% technician utilization, and revenue, plus a resource management module scheduling five technicians across six service bays.
- Applied consistent UI/UX patterns (cards, status badges, responsive grids) across six aviascreens for a cohesive interface.

AI-Enhanced Data Dashboard

Personal Project

Python, Tableau

- Built an interactive Python/Tableau dashboard to analyze structured datasets and surface actionable insights.
- Cleaned, transformed, and preprocessed raw data with Python scripts prior to visualization.
- Applied data visualization best practices to improve usability and support faster decision-making.

Online Voting System

Personal Project

Java, JDBC, MySQL, Object-Oriented Design

- Built a secure, Java-based voting platform using object-oriented design, with a MySQL backend for voter and ballot records.
- Implemented JDBC-driven authentication and vote-validation workflows to prevent duplicate or unauthorized votes.
- Tested and debugged core modules — registration, authentication, vote casting, tabulation — across multiple user scenarios.

EDUCATION

Master of Science in Information Systems

2024 – 2026

Central Michigan University, Mount Pleasant, MI | GPA: 3.7

Bachelor of Engineering in Electronics and Instrumentation Engineering

2020 – 2024

Velagapudi Rama Krishna Siddhartha Engineering College
